WildCars is a company that allows you to rent cars for holidays. The services offered are accessible by calling the switchboard, or by going to the WildCars front desk. In both cases, a WildCars employee will take care of carrying out the required operations on behalf of the customer. These operations may relate to creating, modifying or cancelling a booking.

All operations are carried out using a custom application, run on Android tablets company. Car and reservation data is managed through a PostgreSQL database, which resides on a dedicated Linux server. Note that some employees may be working remotely. A cloud-managed application is used to maintain a read-only backup copy of corporate data. The backup is performed by using a client installed on the data server.

PubblicaMi is a platform that allows its subscribers to edit and share their books with other users, by subscribing to a monthly subscription. The service, offered through a website, is managed by the "PubblicaMI application" application module which has the functions of managing your subscription, managing your writings, searching for books by other users, and finally publishing a book in the platform's catalog.

From a technological point of view, the web application is managed by a Linux web server, while the database related to books resides on another Linux server through the adoption of MySQL. The user can connect via the internet to service with your own device using any browser. Finally, the data relating to the subscriptions used to manage user subscriptions are saved in a cloud database, which the platform accesses for reading and writing through a special technological service.

ArticolaMi is an association that allows research groups to publish their scientific discoveries. The service is offered through a web platform managed by its own application module that allows you to search for conferences, register for a scheduled conference, send an article on your research and consult articles published in past conferences.

Technologically, the web application is managed by a Linux web server, while the conference database resides on another Linux server through the adoption of MySQL. Also on the same node are the database for the history of the articles published and the operational database to collect the articles submitted to conferences yet to be held. The user can connect to the service via the internet with their device using any browser.
