UBooks

UBooks buys and resells used books. Each time it buys a book from a customer, it must ensure to be able to sell it at a higher price to prevent losses. The process through which it buys a book is the following: first of all, the user logs in, then enters book information and details about the condition of the book. Ubooks analyzes the book, to determine its condition. If the condition is not considered sufficient, the book is rejected. Otherwise, it estimates the value of the book and proposes it to the customer. If the customer accepts the offer the book is acquired.

Ubooks has developed a new application to realize this process for users with the following functionalities: insert new books and to compute the offer for customers. The offer for customers is computed by the application using also an external web-service which provides potential sales information on every book upon request. The Ubooks application runs on client side, together with two databases, i.e. an operational database, which stores the current state of the business, and a historical database which keeps tracks of all the books bought and sold by the company. The two databases belongs to the same network to communicate. The system accesses the APIs of the external web-service through the Internet.

Model in Archimate the information service provided by the company and its infrastructure.

Furniture Design

A company decides to provide its customers with a personalized furniture design service. The service is offered through a process that runs when the user calls. The first step consists of collecting the requirements, the second in the individual design of the furniture, the third in the verification of the measurements. All these steps in the process define the design function. The requirements gathering phase is defined by an operator. The design phase is carried out by the user via a web interface.

For the application part, the user uses software called Autocad through its Web Graphical User Interface. Specifically, the Autocad Web GUI supports the second phase of the process defined above, through the design service. Autocad supports the project design functionality, which in turn goes to access the project itself.

As far as the technological part is concerned, in the company a virtual machine managed by a local server is dedicated to storage a Oracle DBMS on Windows NT of furniture projects. Autocad application runs on a server with Windows 11.

GuidaMI

GuidaMi is an electric car manufacturer that distributes spare parts for cars through a network of partner dealerships in the area. GuidaMi receives monthly orders from dealerships.

Requests for spare parts can be sent via a form that can be filled out directly at the GuidaMi help desk, or by telephone through the appropriate call center. The help desk is managed by a specialized front desk employee, while the call center is managed by a call center operator.

The company has implemented a new process that aims to support the management of spare parts orders, through the two main functions of order booking and order cancellation. The entire infrastructure is managed through the use of two nodes, logically divided into managing spare parts data and managing application functions.
