WildCars is a company that allows you to rent cars for holidays. The services offered are accessible by calling the switchboard, or by going to the WildCars front desk. In both cases, a WildCars employee will take care of carrying out the required operations on behalf of the customer. These operations may relate to creating, modifying or cancelling a booking.

All operations are carried out using a custom application, run on Android tablets company. Car and reservation data is managed through a PostgreSQL database, which resides on a dedicated Linux server. Note that some employees may be working remotely. A cloud-managed application is used to maintain a read-only backup copy of corporate data. The backup is performed by using a client installed on the data server.

PubblicaMi is a platform that allows its subscribers to edit and share their books with other users, by subscribing to a monthly subscription. The service, offered through a website, is managed by the "PubblicaMI application" application module which has the functions of managing your subscription, managing your writings, searching for books by other users, and finally publishing a book in the platform's catalog.

From a technological point of view, the web application is managed by a Linux web server, while the database related to books resides on another Linux server through the adoption of MySQL. The user can connect via the internet to service with your own device using any browser. Finally, the data relating to the subscriptions used to manage user subscriptions are saved in a cloud database, which the platform accesses for reading and writing through a special technological service.

ArticolaMi is an association that allows research groups to publish their scientific discoveries. The service is offered through a web platform managed by its own application module that allows you to search for conferences, register for a scheduled conference, send an article on your research and consult articles published in past conferences.

Technologically, the web application is managed by a Linux web server, while the conference database resides on another Linux server through the adoption of MySQL. Also on the same node are the database for the history of the articles published and the operational database to collect the articles submitted to conferences yet to be held. The user can connect to the service via the internet with their device using any browser.

The company HealthyMeals provides a service for the provision of easy-to-prepare meals to its customers who follow a personalized diet. The service is offered through a special web interface and is managed by an application module that allows the creation of a new food plan, the cancellation of a currently present food plan or the modification of a food plan, giving the possibility to exclude from the plan some foods less liked by the customer.

From a technological point of view, a two tier model is adopted where the application logic is contained within the client-side devices, while the food data available to HealthyMeals resides on a dedicated Linux server on premise with a special DBMS to manage them. HealthyMeals relies on an application offered by a third-party company to automatically replenish food if it falls below a certain threshold. For this reason, motive HealthyMeals uses a server-side software that uses a special service created to communicate with the external function for automatic replenishment.

The Voyager company provides a service for personalized vacation planning, including specific services such as booking flights, hotels and museums for selected destinations. The services offered are accessible by calling the switchboard, or by going to the Voyager front desk. In both cases, an employee will take care of carrying out the required operations on behalf of the customer. Voyager offers the possibility to create your own personalized holiday by booking the flight, the hotel and any museums separately, if they are to the customer's liking. Each of these features also has the option to change the details or cancel the booking.

From a technological point of view, a two-tier model is adopted where the application is managed by a Linux server, while the database relating to flights, hotels and museums resides on another Linux server through the adoption of MySQL.
